

Drought Monitoring System for Agriculture in Austria

Project “AgroDroughtAustria-ADA”

Josef Eitzinger (1), Vojko Daneu (1), Gernot Bodner (1), Gerhard Kubu (1), Willibald Loiskandl (1), Peggy Macaigne (1), Sabina Thaler (1), Andreas Schaumberger (2), Christoph Wittmann (3), Erwin Murer (4), Carmen Krammer (4), Mirek Trnka (5), and Michael Hayes (6)

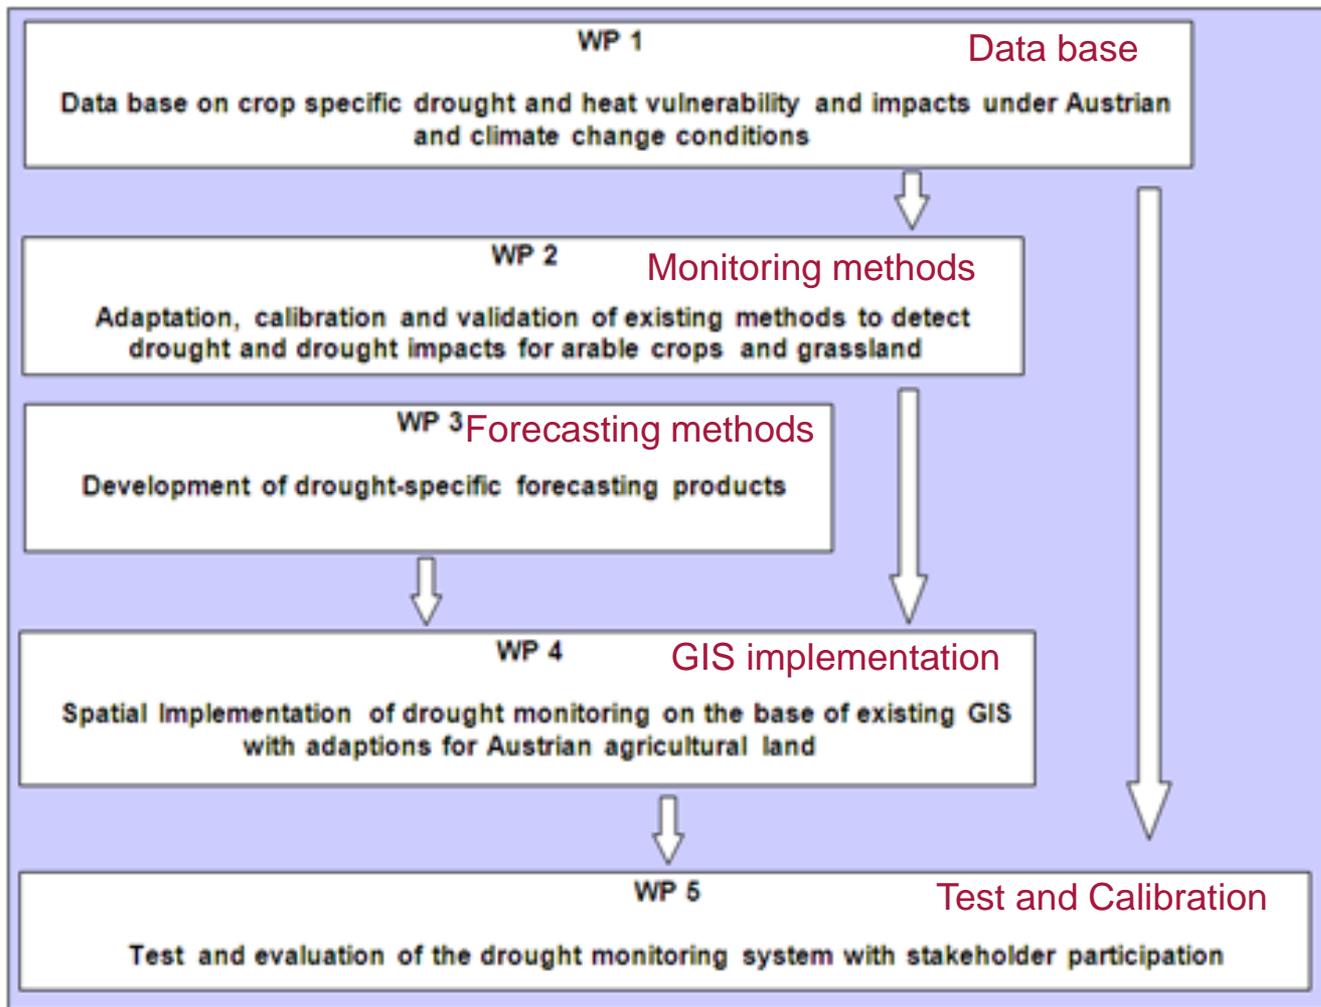

- (1) Univ. of Natural Resources and Life Sciences, BOKU, Vienna, Austria**
- (2) Lehr- und Forschungszentrum für Landwirtschaft Raumberg Gumpenstein LFZRG**
- (3) Central Institute for Meteorology and Geodynamics (ZAMG),**
- (4) Bundesanstalt für Wasserwirtschaft – BAW, Petzenkirchen,**
- (5) Global Change Research Centre AS CR v.v.i, CZ,**
- (6) National Drought Mitigation Center NDMC, USA**

The aim of the ADA project (2013-2016) is to develop and test a crop specific drought monitoring and forecasting system for agriculture in Austria.

Objectives:

- 1) Establish a data base and develop methods for crop drought and heat stress and yield impact detection**
- 2) Establish a forecasting approach modelling drought occurrence (10 days and seasonal) and GIS implementation**
- 3) Adapt and validate soil water content calculation methods (SOILCLIM Model) and GIS implementation**
- 4) Test the crop specific drought monitoring system for operational use**

ADA – Work packages

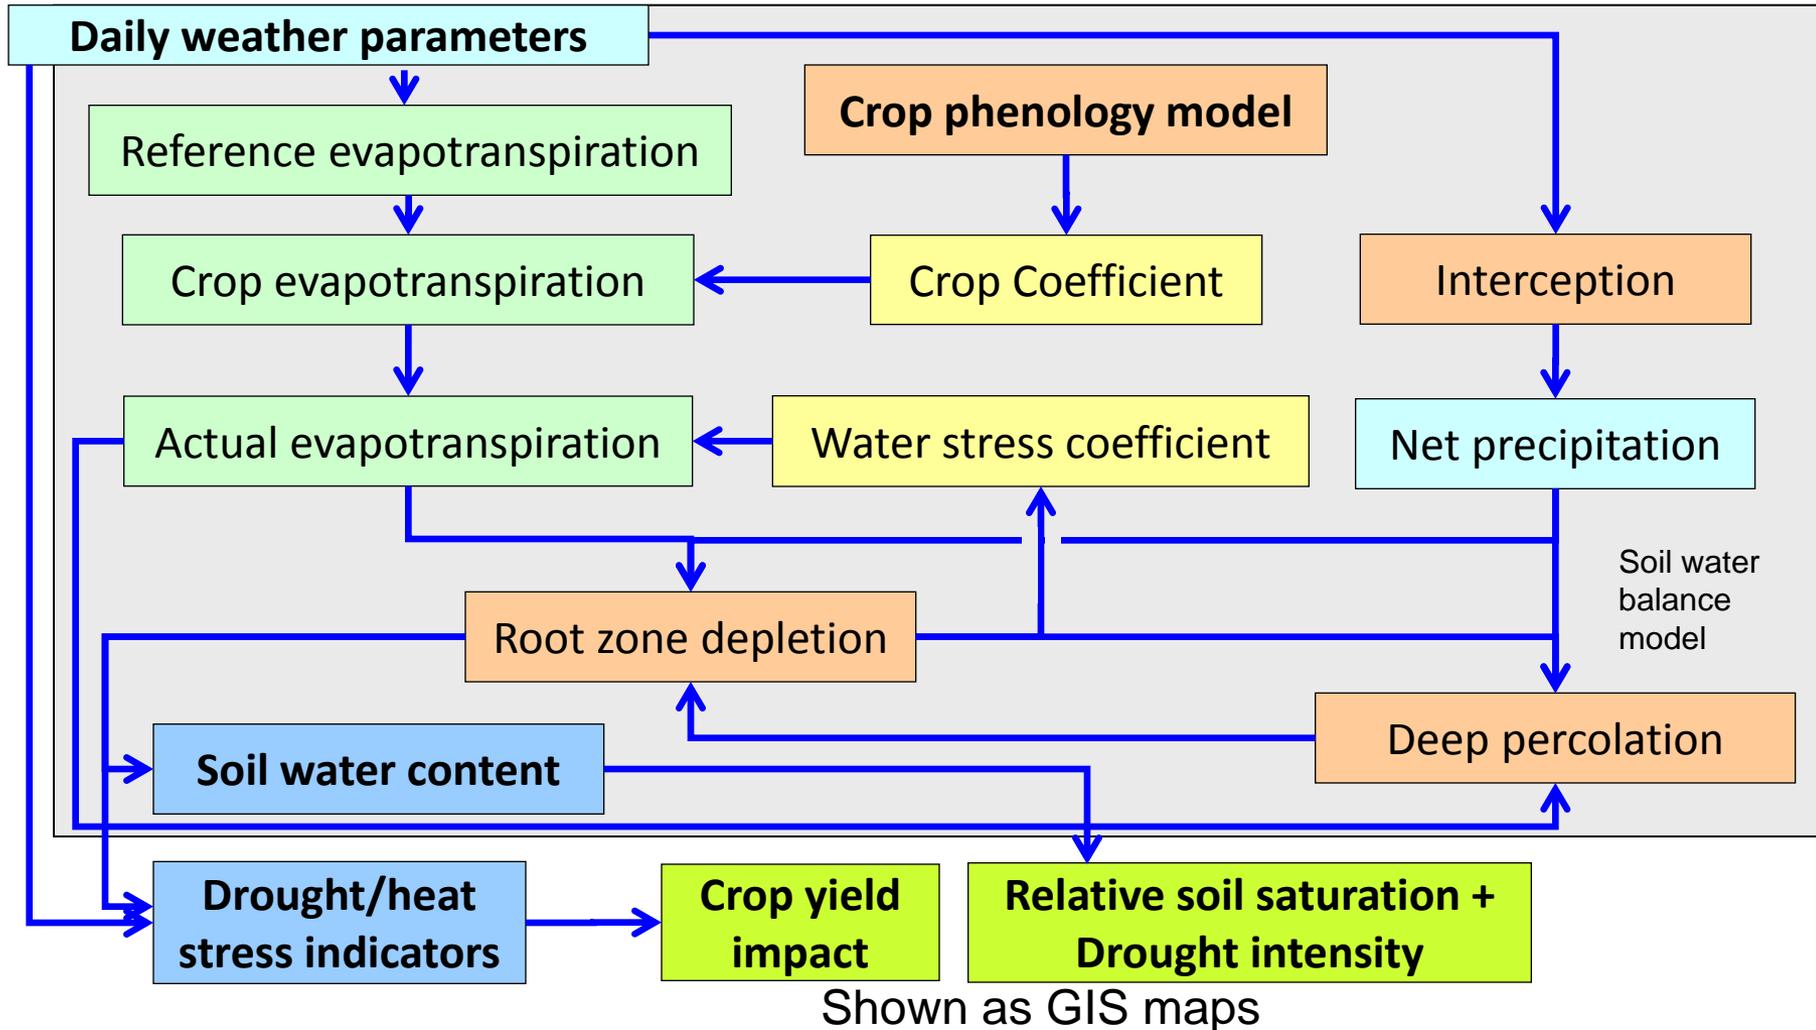

ADA GIS model structure

lebensministerium.at

Soil water balance model SOILCLIM (colored area) based on ALLEN et al. (1998):
Crop evapotranspiration, FAO paper No 56

ADA soil water balance models

Soil water content [mm] - swc: result of the water balance computations

- The maximum soil water content equals the soil water content at field capacity **swc_fc**. With no rain, day for day the swc is reduced due to the water use of the plants till it reaches the water content at permanent wilting point **wilt**. From that point on no more water can be extracted by the plants and the water content at permanent wilting point is kept in the soil for extended periods.
- swc, swc_fc and wilt enable the computation of the relative soil saturation

Relative soil saturation [%] - rss (=MAPPED OUTPUT)

The soil water content is expressed as proportion of water soil profile saturation in %, denominated as relative soil saturation rss

- $rss = (swc - wilt) / (swc_fc - wilt)^*$

*Trnka M.; Hlavinka P.; Semerádová D.; Balek J.; Možný M.; Štěpánek P.; Zahradníček P.; Hayes M.; Eitzinger J. and Žalud Z. (2014): Drought monitor for the Czech Republic - www.intersucho.cz. Rožnovský, J., Litschmann, T., (eds): Mendel a bioklimatologie. Brno, 3.– 5.9.2014, ISBN978-80-210-69831

Drought intensity (= MAPPED OUTPUT)

- ADA uses the soil water content as crop specific drought indicator to quantify the so called drought intensity.
- Drought intensity can be expressed as a measure of deviation from the statistically derived „normal“ state. For each grid cell the current soil water content at a given day is compared to the soil water content distribution of the historical years from 1981 till 2015 for the same day +/- 10 days. The drought intensity value expresses the probability of repetition of soil moisture in the given day.
- ADA soil water content deviations are statistically calculated using the percentile method.

ADA soil water balance settings

- Soil depth considered for the soil water balance computations:
 - grass: top layer 0-20 cm, sub layer 20-40 cm
 - arable crops: top layer 0-40 cm, sub layer 40-100 cm
- Weighting factor for the two soil layers: 60% (top), 40% (sub). I.e. The top layer is responsible for 60% of the total evapotranspiration value and the sub layer for 40%.
- Full water saturation at the beginning of each computation year (optional: continuous water saturation computation without reset)
- Computation of all water balance parameters related to calculated crop specific phenological stages (Kc-factors)

Heat and drought stress indicators & yield reduction model

Heat and drought stress indicators and sums

- Heat and drought stress indicators are calculated each day of the year within the water balance computation module of the ADA software.
- Drought and stress indicator sums are calculated from crop specific start days till the end of the crop's phenological „late“ phase (grass: till the second cut of a 3 cut regime).

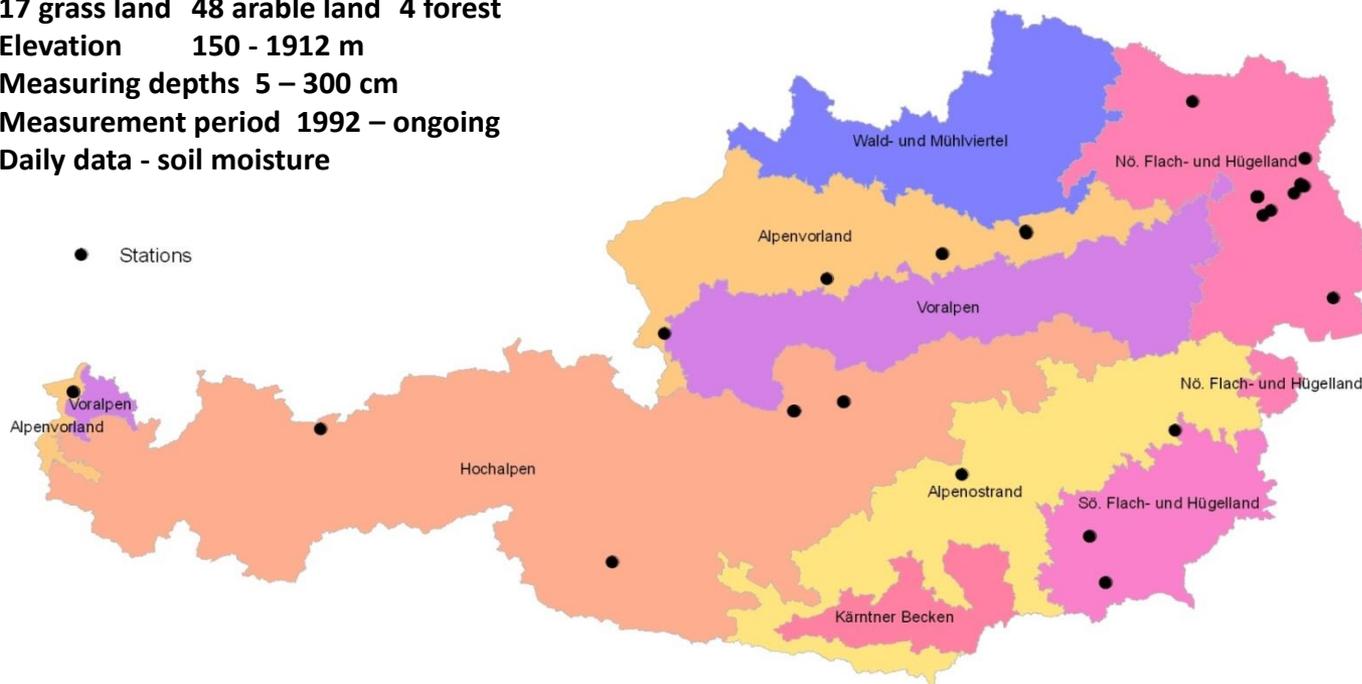

Crop yield reduction (=MAPPED OUTPUT)

- Yield reduction formulas have been developed by the project partners and have been incorporated into the ADA software.
- The yield reduction formulas are linear functions with crop specific equation coefficients A and B as well as the drought stress indicator sum as the independent variable x: $y = B \cdot x + A$
- Computation Results: relative yield reduction as percentage of maximum yield
- Yield reduction classification: ■ 0-5% ■ 5-30% ■ 30-60% ■ >60%

Validation data base for simulated soil moisture – Available Soil Water Stations & Main Production Areas

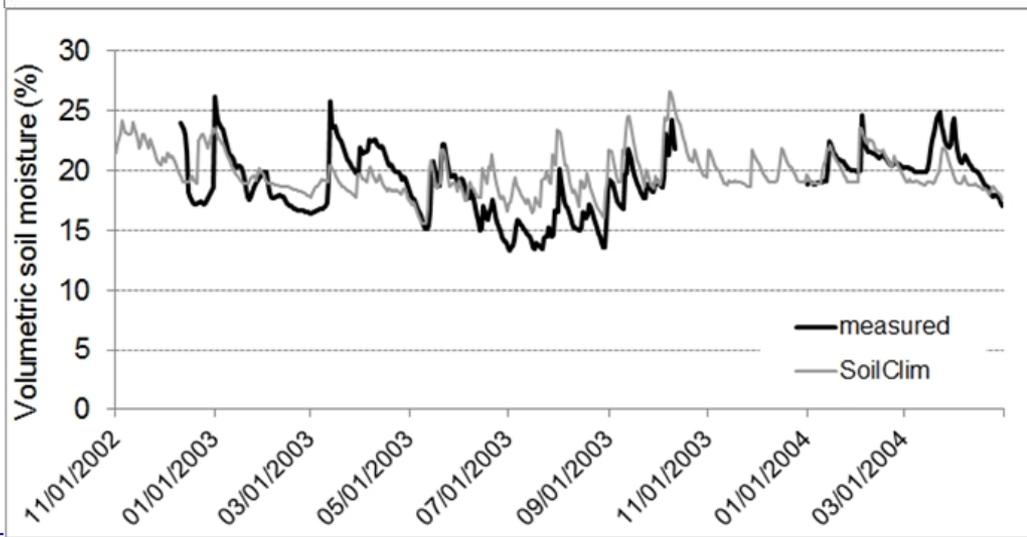

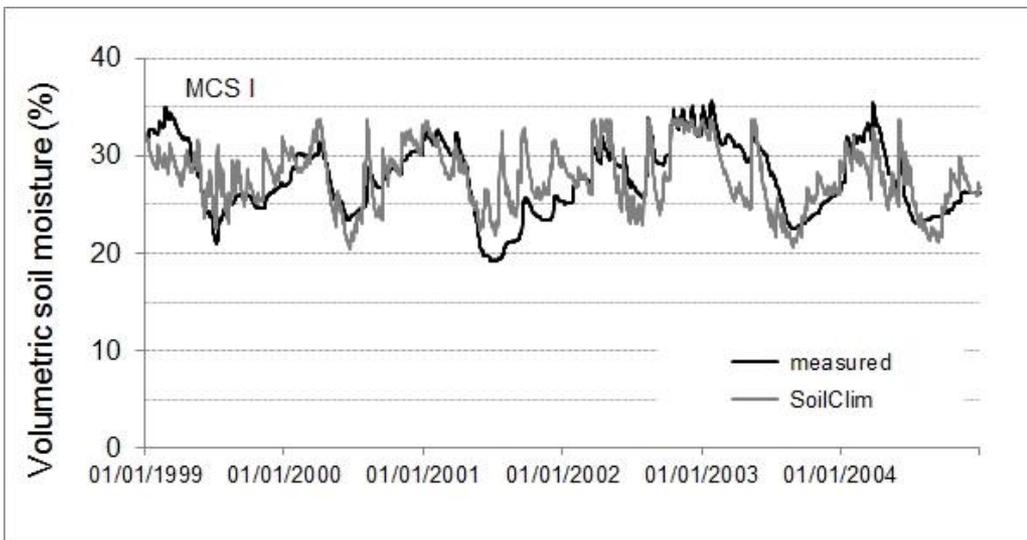

21 Locations 69 plots
17 grass land 48 arable land 4 forest
Elevation 150 - 1912 m
Measuring depths 5 – 300 cm
Measurement period 1992 – ongoing
Daily data - soil moisture

● Stations

Krammer, 2013

Soil water balance model (SOILCLIM) - evaluation

Examples of the SoilClim model evaluation

at the Hirschstetten lysimeter site (above)

and grassland site Gumpenstein (below)

(top soil layer 0-40 cm).

Crops specific responses to drought/heat

1) Drought impacts:

Dominating effects on biomass accumulation (Photosynthesis rate depression), biomass partitioning and yield forming processes (i.e. corn filling)

(crop yields determined by vegetative development only:
i.e. grassland, sugar beet, biomass crops)

2) Heat impacts:

(further forced by water stress conditions)

Dominating effects on phenology, corn filling and fertility (flowering period!) (especially crop yields determined by generative development:
Grain maize, cereals, ..)

Estimating drought / heat impacts on crops

1) Development/implementation of crop phenology model (Kc model)

Methods: Crop model application under Austrian conditions

2) Development and test of drought and heat impacts on yield risk (stress indicators) and yield vulnerability (yield depletion from unstressed conditions)

Methods: Statistical analysis of crop yield data

Crop Coefficient Model for ADA

Reference Evapotranspiration (ET₀) for December, January and February is a constant value of 0.2 mm.

Start of Growing Season (SGS): First day of 5 consecutive days with daily mean temperatures above 5°C

Start of Growing Season for Maize (SGS-M): First day of 5 consecutive days with daily mean temperatures above 10°C

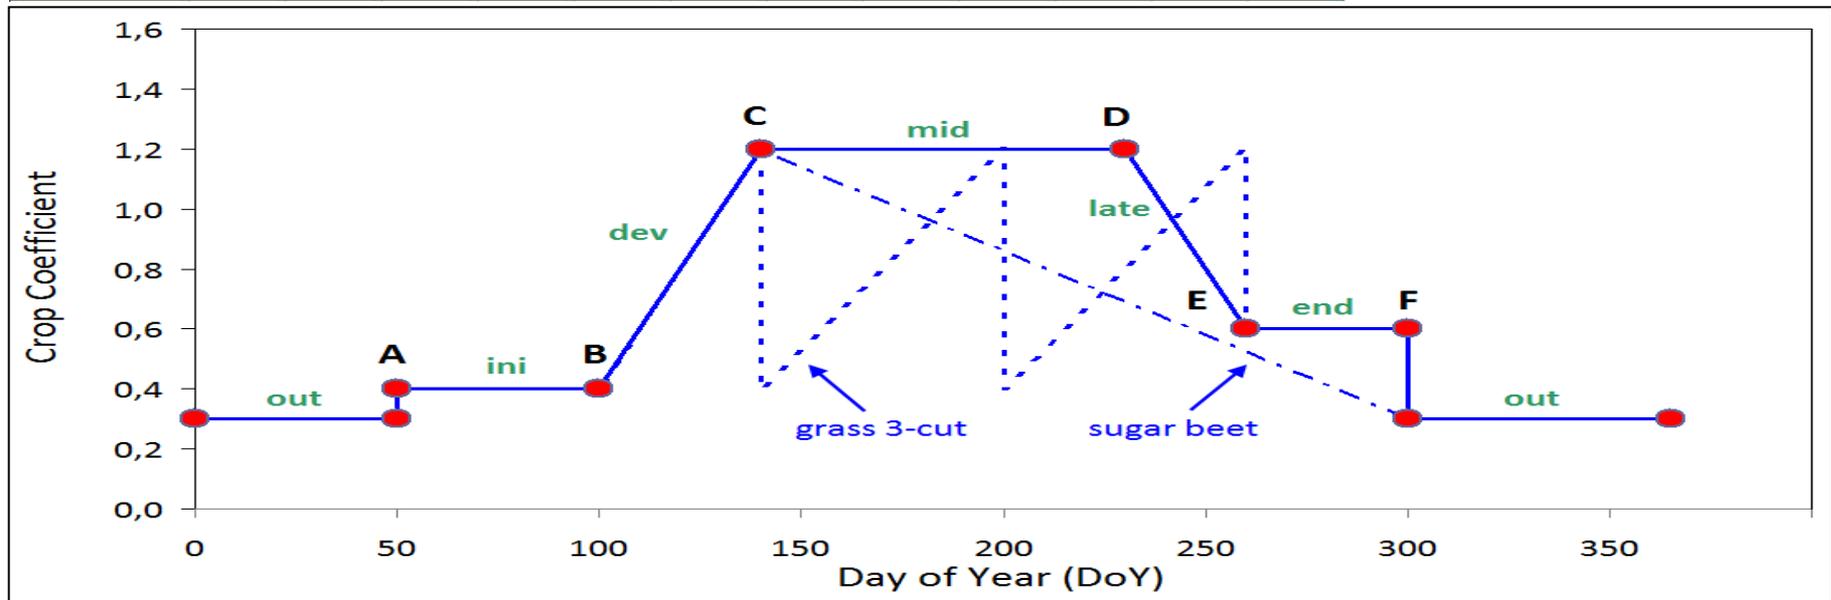

Base temperature for calculation of degree day temperature sum (BT): 5 °C

Base temperature for calculation of degree day temperature sum for Maize (BT-M): 8 °C

Culture	Initial (Evaporation)		Crop Development		Mid-Season		Late Season		End of Growing			
	Entry of A		Entry of B		Entry of C		Entry of D		Entry of E		Entry of F	
	Kc	Time	Kc	Time	Kc	Time	Kc	Time	Kc	Time	Kc	Time
Grassland (3-cut)	Will be done by LFZ Raumberg-Gumpenstein (according to Schaumberger, 2011)											
Winter Wheat	0.4	01.03.	0.4	SGS	1.2	350	1.2	692	0.5	+14 days	0.5	30.11.
Spring Barley	0.4	01.03.	0.4	SGS	1.2	502	1.2	568	0.5	+14 days	0.5	30.11.
Spring Maize	0.4	01.04.	0.4	SGS-M	1.2	249	1.2	1238	0.5	+14 days	0.5	30.11.
Sugar Beet	0.4	01.03.	0.4	300	1.2	2400					1.1	31.12.

Phenology model

(to be used for evapotranspiration calculation and stress indicators)

Stress indicators

Impact of **drought and heat** on crop stress (by risk measures) and yield level (by vulnerability measures)

A. Crop risk measures

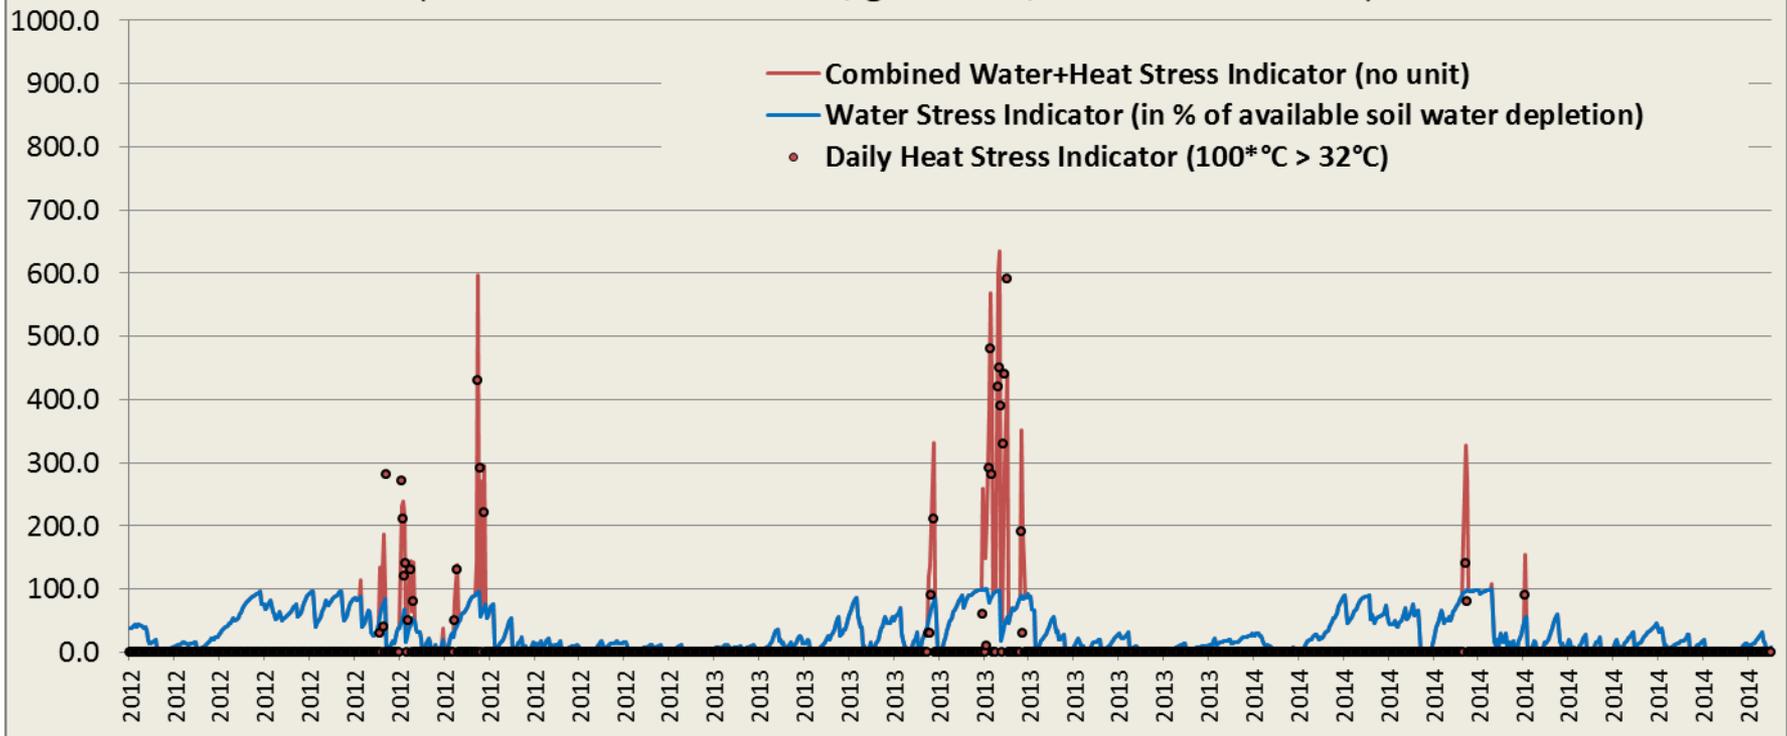

1. **a) General drought indicator** (soil water content deviation in regard to the seasonal normal) and **b) crop specific water stress factor** (plant available soil water (AWC) content depletion - linear increasing stress beyond 30% AWC depletion)
 2. **Heat stress factor (actual and accumulated)**
 - number of days above maximum temperature limit
 - Duration above a critical Temperature
 3. **Heat stress x crop specific water stress factor**
(way of combination of ad 1+2; i.e. reduction of heat stress impact above 70% AWC)

B. Crop vulnerability measures

1. **Crop specific heat and drought stress response at different phenological states expressed by yield depletion from normal**

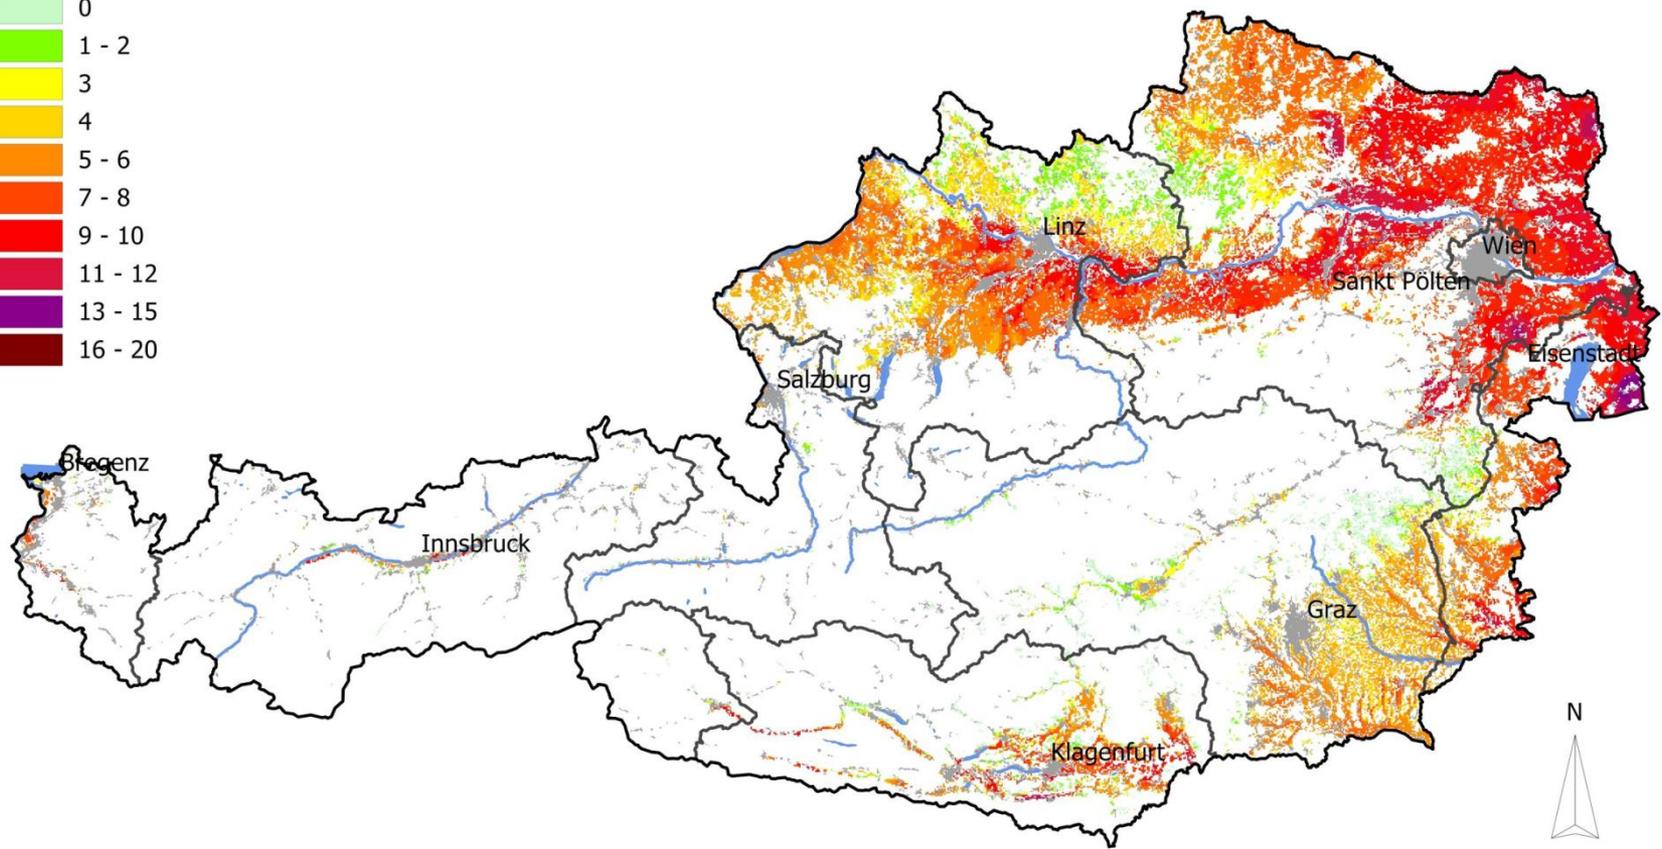

Calibration/validation with observed crop yield data in Lower Austria, Burgenland, Styria (district level)

Example of ADA water and heat stress indicators (conditions: medium soil, grassland, Ternitz 2012-2014)

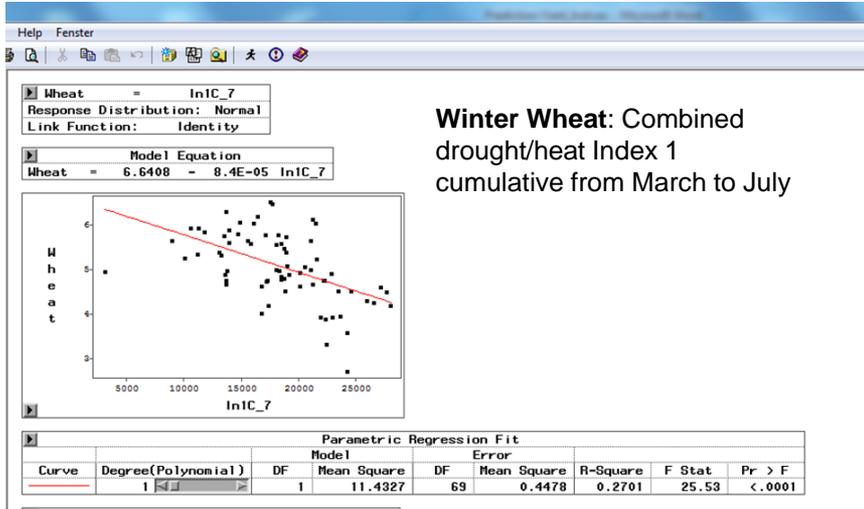

Number of days with $T_{max} > 32^{\circ}\text{C}$
01.06.2015 - 27.07.2015

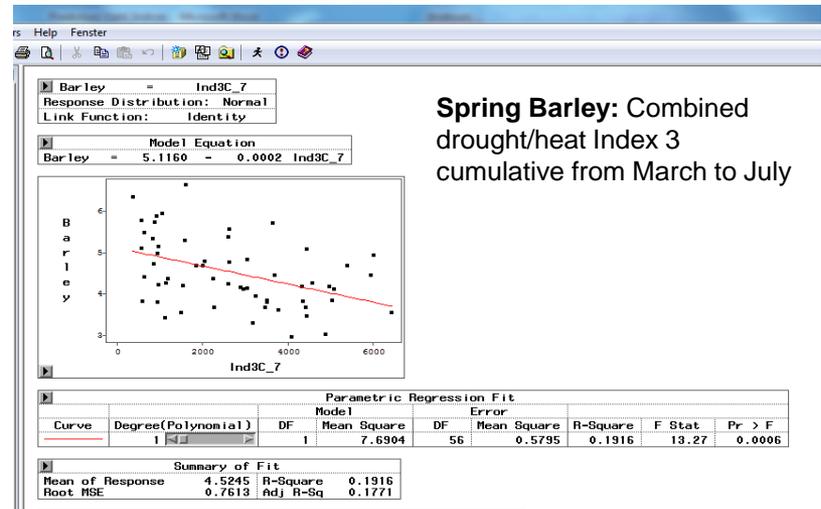

Crop Stress Indicator Sums

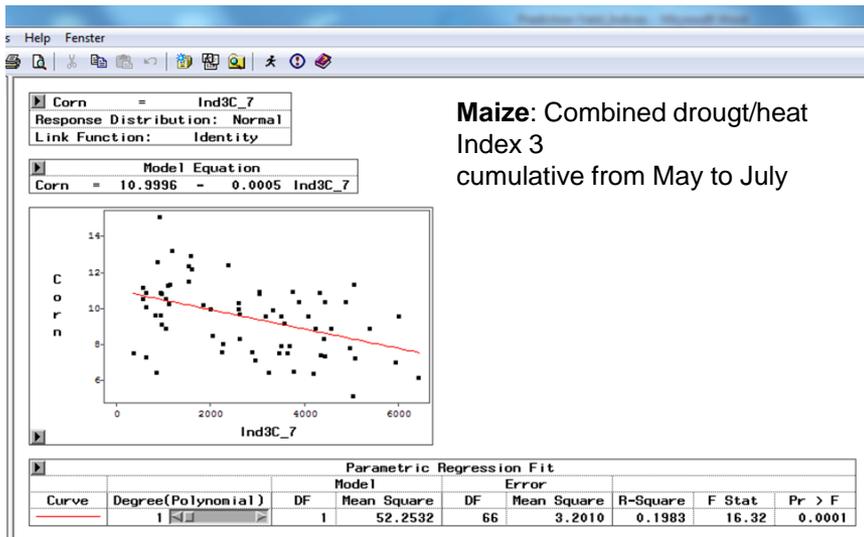

Performance of pre-defined combined drought-heat impact indicators

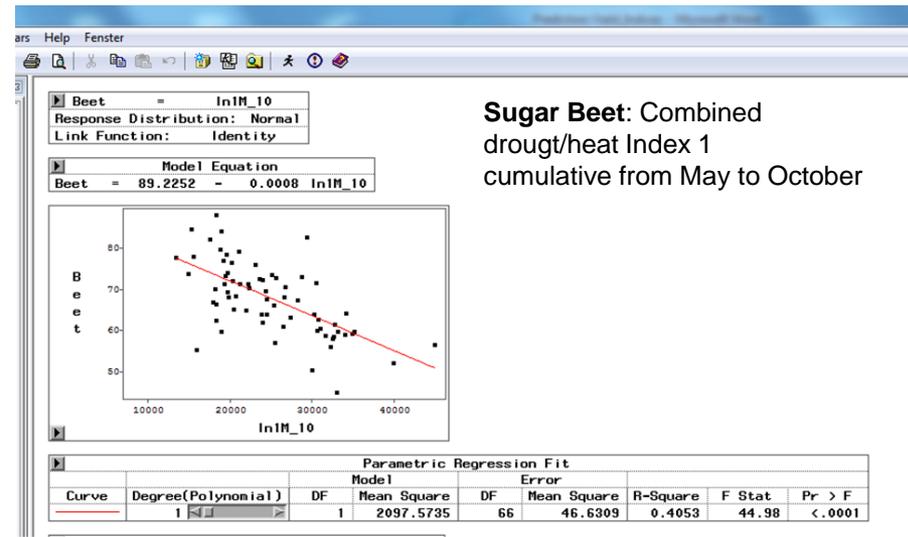

Winter Wheat: Combined drought/heat Index 1 cumulative from March to July

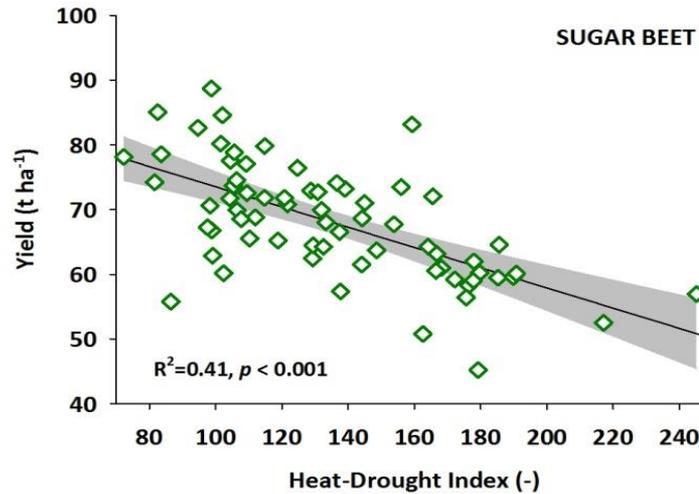

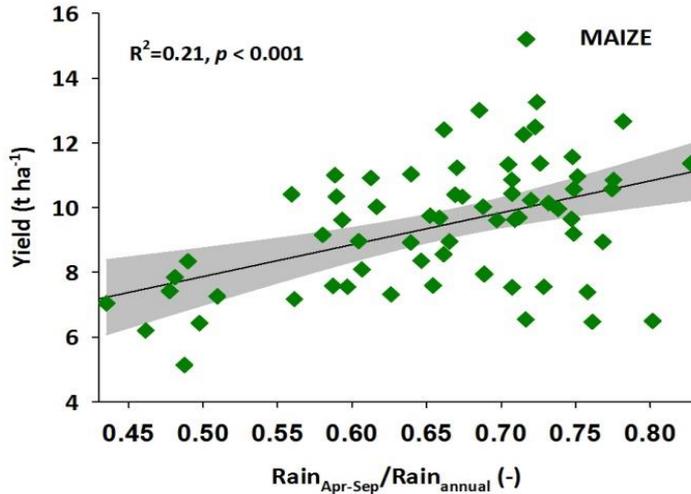

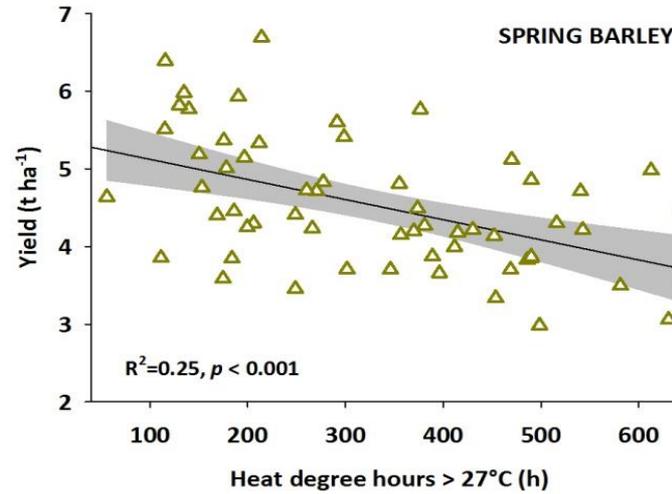

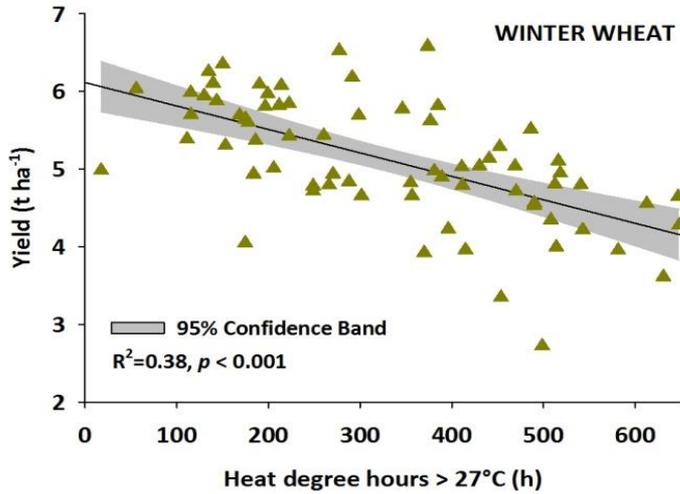

Spring Barley: Combined drought/heat Index 3 cumulative from March to July

Maize: Combined drought/heat Index 3 cumulative from May to July

Sugar Beet: Combined drought/heat Index 1 cumulative from May to October

Multi-site evaluation of crop yield vs. drought and heat impacts (Best performing for Lower Austrian sites)

Best performing stress and yield impact indicators

Crop	Daily heat indicator	Daily drought indicator	Daily drought/Heat indicator	Actually implemented yield depression functions		
				YD =	Σ	R ²
Grassland 2nd cut		$WSI = DR * 100.0 / TAW$		$YD = 87.53 + (-.0055 * \Sigma WSI)$	Σ 1.5. - cut date	R ² =0.23
Winter Wheat	$\Sigma HDH > 27$	$WSI = DR * 100.0 / TAW$	TM > 26: CSI = WSI * (TM - 25.0) TM < 26: CSI=WSI	$YD = 6.64 + (-.000084 * \Sigma CSI)$	Σ 1.3. - harvest	R ² =0.27
Spring barley	$\Sigma HDH > 27$	$WSI = DR * 100.0 / TAW$	WSI > 33 & TM>30: CSI= ((TM-29)*WSI)-33	$YD = 5.11 + (-.0002 * \Sigma CSI)$	Σ 1.3. - harvest	R ² =0.20
Maize		$WSI = DR * 100.0 / TAW$	WSI > 33 & TM>30: CSI= ((TM-29)*WSI)-33	$YD = 10.99 + (-.0005 * \Sigma CSI)$	Σ 1.5. - harvest	R ² =0.20
Sugar beet		$WSI = DR * 100.0 / TAW$	TM > 26: CSI = WSI * (TM - 25.0) TM < 26: CSI=WSI	$YD = 89.22 + (-.0008 * \Sigma CSI)$	Σ 1.5. - harvest	R ² =0.41

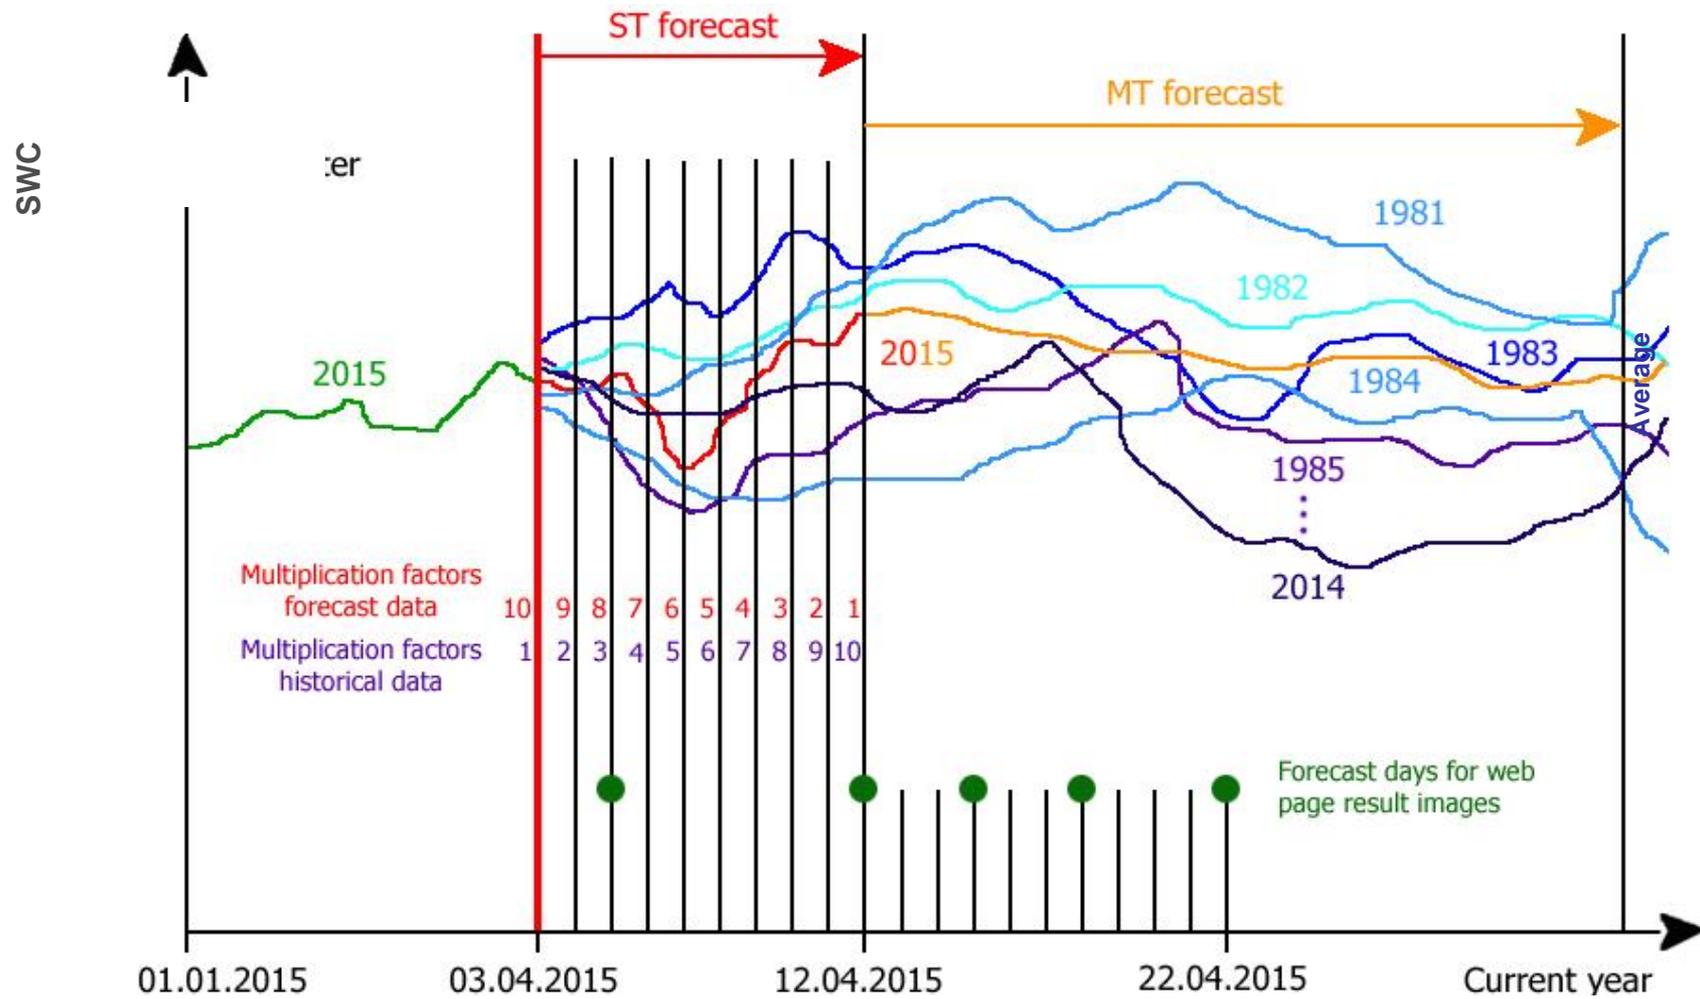

WSI = water stress indicator [%]
 DR = root zone depletion [mm]
 TAW = available soil water content at available field capacity [mm]
 CSI = combined water and heat stress indicator [-]
 TM = maximum daily temperature [°C]
 YD = Yield depression relative to not stressed conditions [%]
 HDH: Heat Degree Hours [°C]

ADA forecast data & facts

- ADA forecast computations are based on meteorological forecast data (short term forecast of 10 days) and averaged meteorological data of historical years (medium/long term forecast of any number of days).
- Meteorological forecast data is delivered by ZAMG (Zentralanstalt für Meteorologie und Geodynamik, Wien). Historical meteorological data is available from the ADA database.
- The ADA computation time (presently up to 2 days for whole Austria) allows forecast updates every three days.
- All ADA forecast drought computations (phenological entry dates, RSS, DI, yield reduction, etc.) are run in analogy to the computations of historical years – the only difference is the manipulated meteorological input data.

Forecast using weighted and averaged meteorological data

ADA weather inputs (ZAMG)

INCA Analysen und Vorhersagen von numerischen Wettermodellen

Parameter	ab Jahr	Forecast (d)	Auflösung	Anmerkung
Minimumtemperatur (24 h) [$^{\circ}\text{C d}^{-1}$]	2003	3 bzw. 10	1 km*)	
Maximumtemperatur (24 h) [$^{\circ}\text{C d}^{-1}$]	2003	3 bzw. 10	1 km	
Mitteltemperatur (24 h) [$^{\circ}\text{C d}^{-1}$]	2003	3 bzw. 10	1 km	
Tagesmitteltemperatur (12 h) [$^{\circ}\text{C d}^{-1}$]	2003	3 bzw. 10	1 km	abhängig von Modellen
Globalstrahlung [$\text{MJ m}^{-2} \text{d}^{-1}$]	2003	3 bzw. 10	1 km	Umrechnung auf MJ m^{-2}
Relative Luftfeuchte [$\% \text{d}^{-1}$]	2003	3 bzw. 10	1 km	oder Evapotranspiration
Wind [$\text{m s}^{-1} \text{d}^{-1}$]	2003	3 bzw. 10	1 km	oder Evapotranspiration
Evapotranspiration (PM) [mm d^{-1}]	2003	3 bzw. 10	1 km	
Schneebedeckung (SWE) [mm d^{-1}]	2003	3 bzw. 10	1 km	vorerst nur Ja/Nein (mit W. Schöner besprechen)
Niederschlag [mm d^{-1}]	2003	3 bzw. 10	1 km	

*) Die räumliche Auflösung der Wettermodelle liegt ursprünglich bei 4.8km für die nächsten 3 Tage (ALARO) und ca. 16.km für die nächsten 10 Tage (ECMWF). Die Daten werden jedoch auf das 1km INCA Gitter interpoliert und in dieser Auflösung zur Verfügung gestellt.

- Analysen und Vorhersagen von meteorologischen Parameter aus verschiedenen Modellen und Ensemblesystemen für ADA Monitor zur Verfügung gestellt
- Vorhersagegüte der INCA Analysen und Kurzfristprognosen untersucht, sowie der zusätzliche Mehrwert von INCA/Ensemble INCA zu NWP-Modellen im Vorhersagezeitraum bis +12h gezeigt.
- Implementierung und Test einer neuen Methode zur Abschätzung der Ungenauigkeiten in der Prognose von Bodentemperatur und Bodenfeuchte in LAEF (-> SPPT)
- Untersuchung der Vorhersagegüte der NWP-Modelle für dürrerelevante Parameter, mit speziellem Focus auf probabilistische (Ensemble-) Prognosen, anhand einer detaillierten Fallstudie für den Sommer 2015 zeigt:
 - Erste Signale für ungewöhnlich warmen und trockenen Juli bereits in den 7-Monatsprognosen der ECMWF Saisonalvorhersage sichtbar
 - Deutliche Signale, sogar leichte Überschätzung der mittleren Temperatur in den 1-Monatsprognosen
 - Vorhersagequalität von LAEF im Sommer 2015 leicht schlechter als im vorangegangenen Sommer

Prognose für Juli vom 1.1.2015:
- pos. Temperaturanomalie > 1Grad

Anomalie 2m Temperature, FCST from 20150701

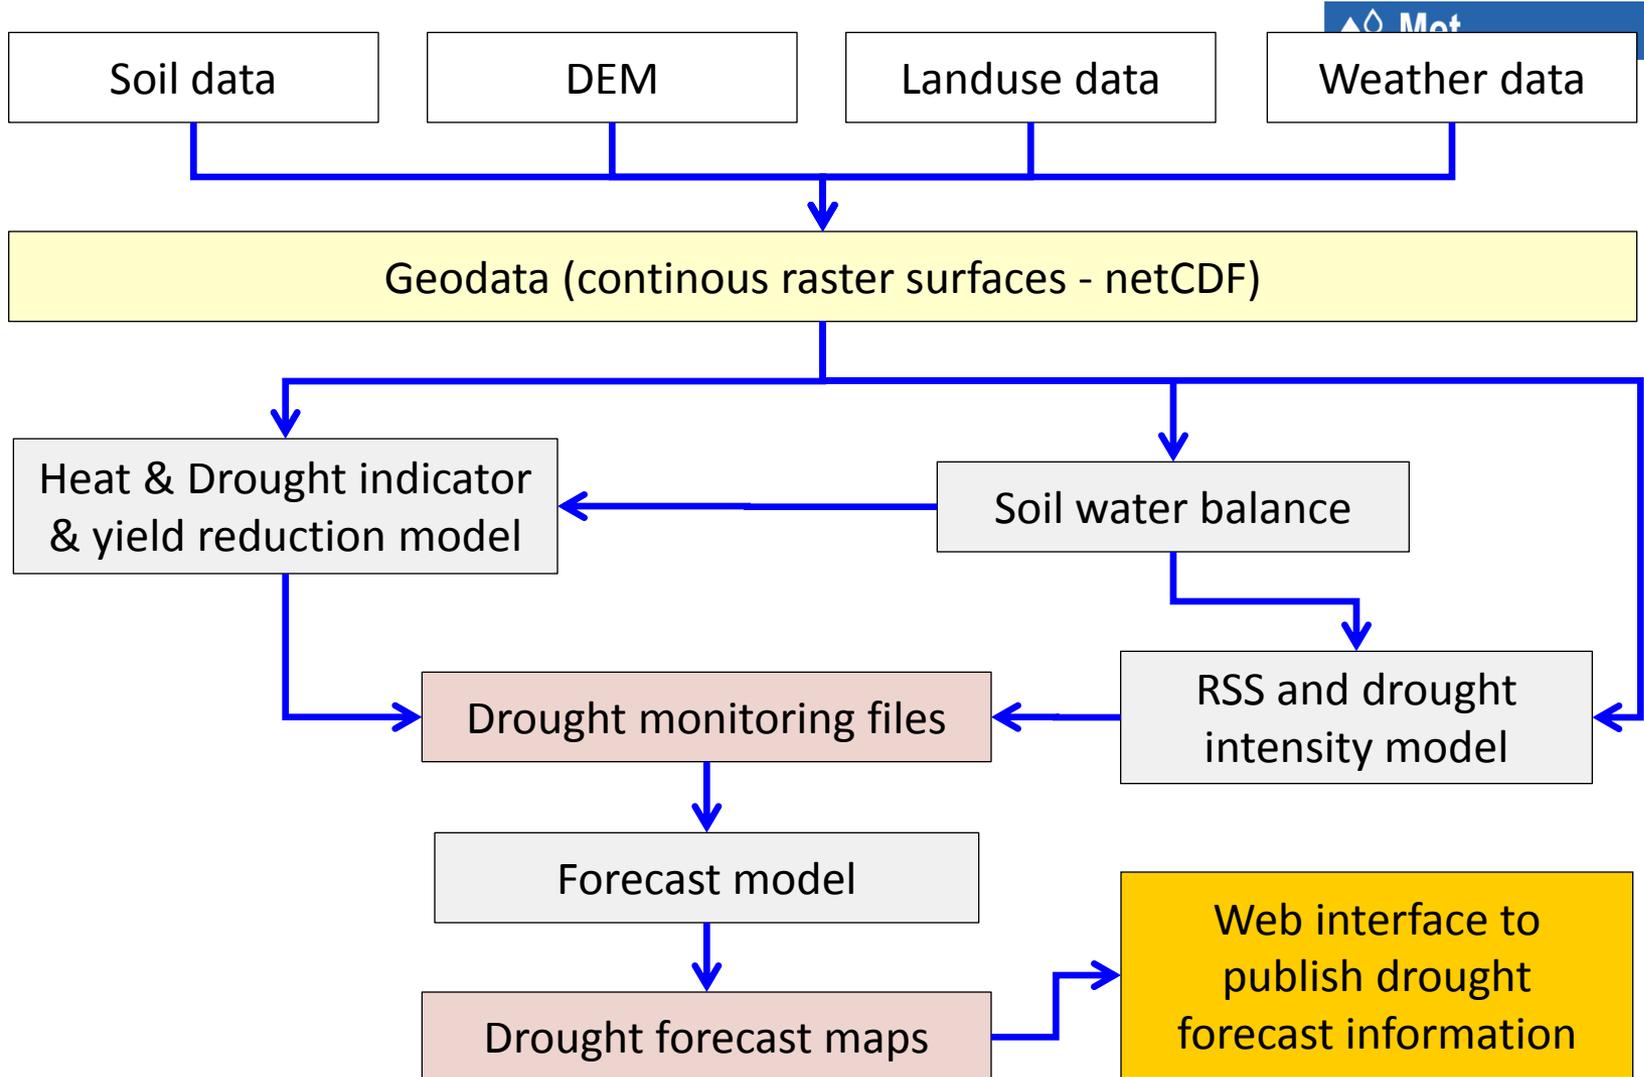

Prognose für Juli vom 1.7.2015:
- pos. Temperaturanomalie > 3Grad,
- leichte Überschätzung im Osten

ADA: Data flow in the GIS model

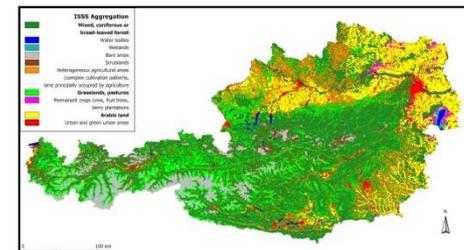

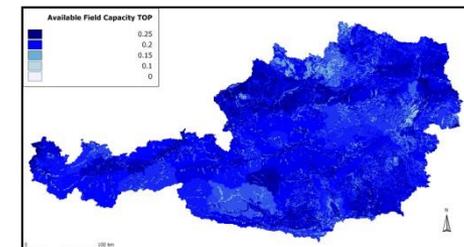

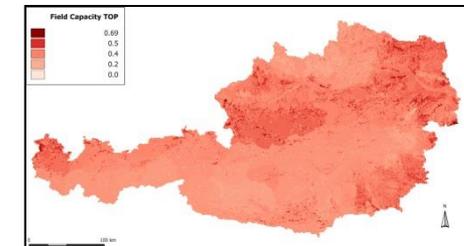

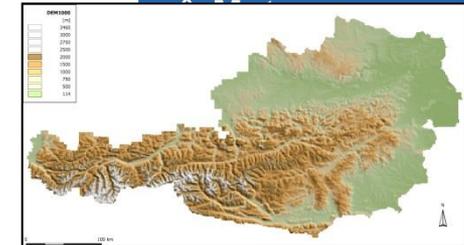

lebensministerium.at

ADA GIS input data types

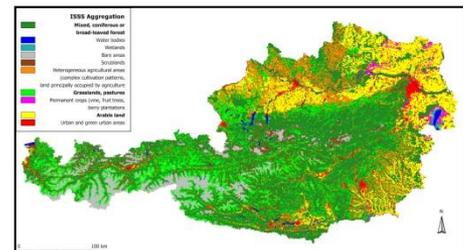

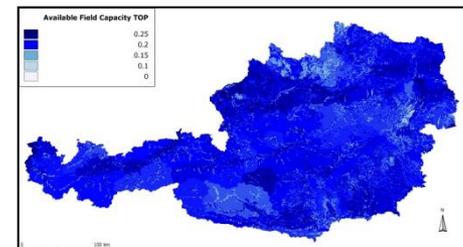

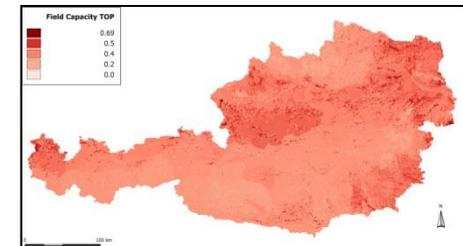

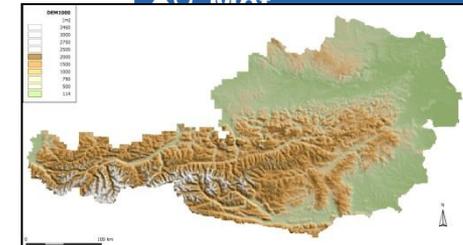

- All input/output data using the **netCDF** file format
 - Data format for reading/writing large scientific data files developed by American company Unidata
 - Self describing (reducing the incidence of errors)
 - High-performance data format
 - Single and multidimensional grids (continuous surfaces)
- **Spatial resolution:**
 - DEM, Meteorological input data: 1000 m
 - Soil and landuse input data: 500 m
 - Output data (ET0: 1000 m, all other data: 500 m)
 - Resolution is increased using simple split algorithm
- **File Coverage:**
 - Complete territory of Austria

Which data is used?

- Digital elevation model [m]: 1 layer
- Field capacity [Vol%]: 1 top layer (0,4 m)
1 sub layer (0,6 m)
- Available field cap. [Vol%]: 1 top layer (0,4 m)
1 sub layer (0,6 m)
- Agricultural landuse types: Grassland and arable land: winter wheat, spring barley, spring maize, sugar beet
- Met. data: Relative humidity [%], Wind [m/s], Temperature [°C], Precipitation [mm], Radiation [MJ/m² day] *

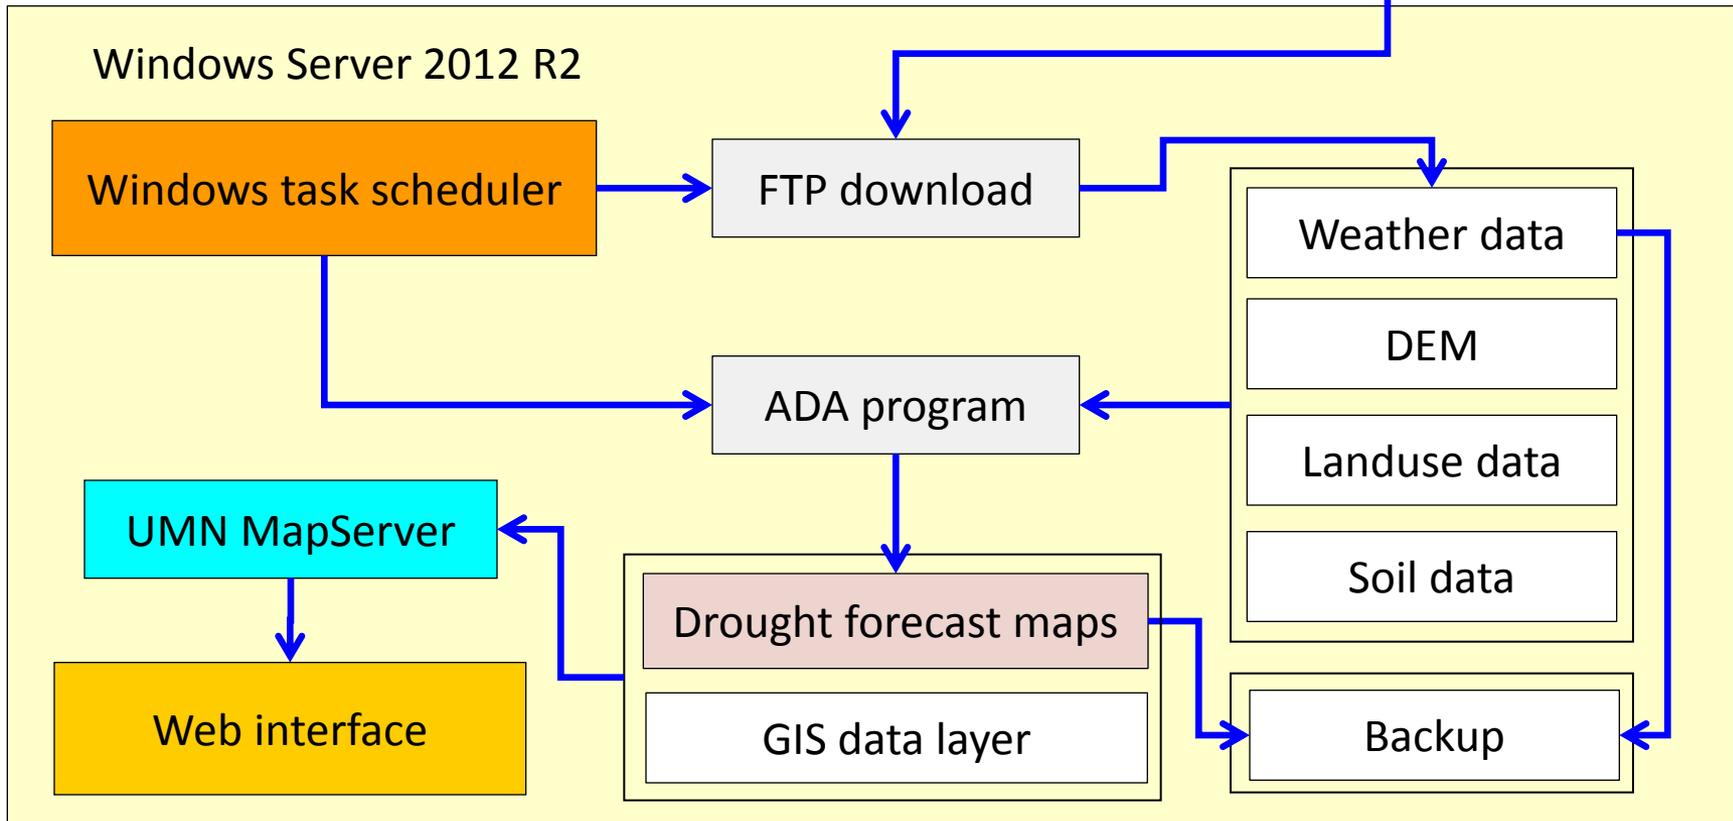

- * **1981 - 2002:** Spatial interpolation of weather data for the period before INCA data is available
- 2003 – now (+ 10 days forecast):** INCA weather data interpolated by ZAMG

ADA web architecture

- Forecast run every third day
- Backup of all forecast met and result data

Agro Drought Austria

Dargestellte Karte:

Parameter: **Pflanzenbestand:**

Berechnung und Darstellung der ADA Parameter:

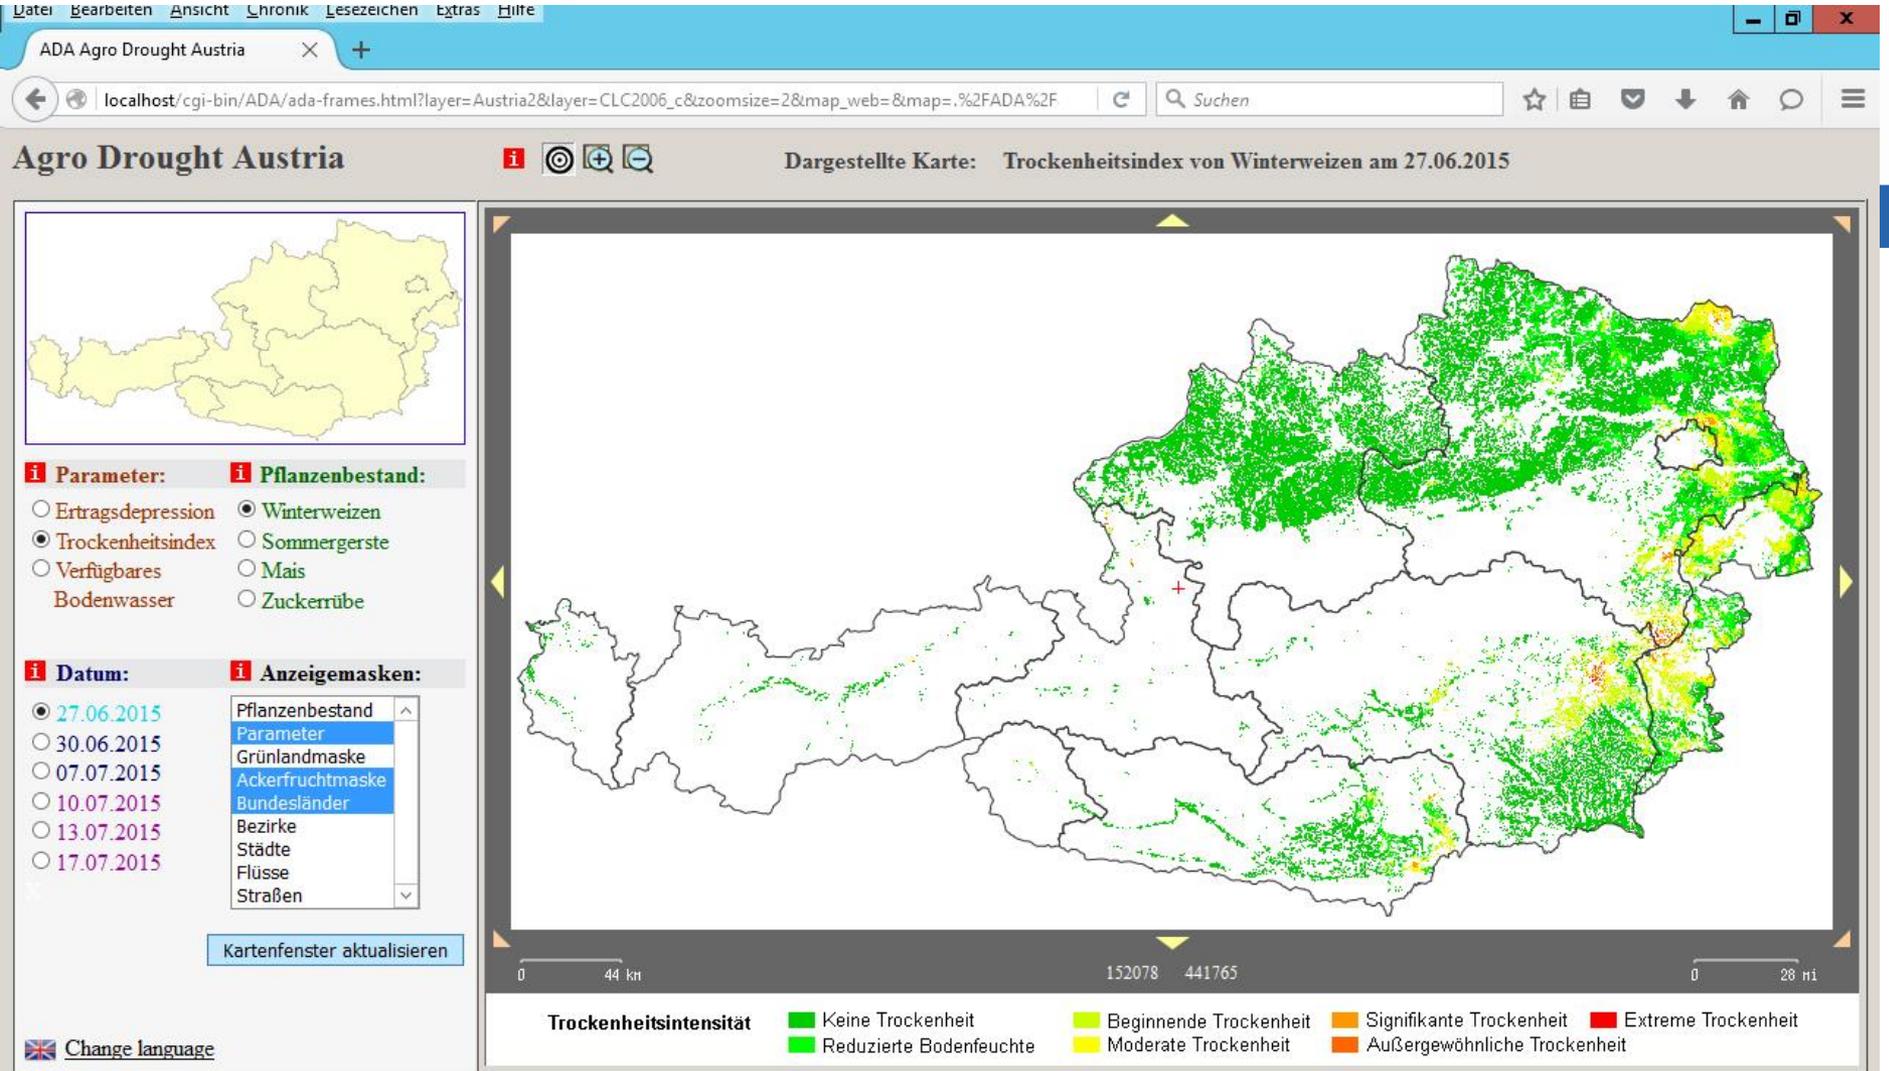

- Drei ADA Parameter können dargestellt werden - die Ertragsdepression [%], die Trockenheitsintensität und das verfügbare Bodenwasser [%]. Für jeden Parameter können unterschiedliche ADA Pflanzenbestandstypen und Berechnungstage gewählt werden.
- Ertragsdepression:** Trockenheit und hohe Temperaturen haben einen entscheidenden Einfluss auf das Pflanzenwachstum. Die Größe der zu erwartenden Ertragseinbußen kann durch zwei kalibrierte Indikatoren quantifiziert werden: durch einen Trockenheitsstressindikator für Grünland und einen kombinierten Indikator (Trockenheitstress und Hitzestress) für die vier ADA Ackerfrüchte. Die Indikatorwerte basieren auf Bodenwasserbilanzberechnungen für eine Bodenreferenztiefe von 0-20 cm. Die Ertragsminderungswerte für Grünland gelten für den zweiten Schnitt im 3-Schnittregime (mit brauchbarer Aussage auch für den Gesamtjahresertrag).
- Trockenheitsintensität:** Der Bodenwassergehalt wird als kulturartbezogener Trockenheitsindikator zur Quantifizierung der Trockenheitsintensität herangezogen. Die Trockenheitsintensität ist ein Maß für die Abweichung von einem statistisch ermittelten „Normalwert“. So bedeutet ein hoher Trockenheitsintensitätswert an einem beliebigen Tag des Berechnungsjahres, dass der Bodenwassergehalt an diesem Tag signifikant geringer ist, als an demselben Tag anderer historischer Jahre. Die Trockenheitsintensitätswerte basieren auf Bodenwasserbilanzberechnungen mit einer Bodenreferenztiefe von 0-40 cm für Grünland und 0-100 cm für die vier ADA Ackerfrüchte.
- Verfügbares Bodenwasser:** Das (pflanzen)verfügbare Bodenwasser ist ein geeigneter Indikator um Trockenstress für Pflanzen abzuschätzen. Es ist eine Funktion von aktuellem Bodenwassergehalt, Bodenwassergehalt bei Feldkapazität und Welkepunkt. Die Werte des verfügbaren Bodenwassers basieren auf Bodenwasserbilanzrechnungen mit einer Bodenreferenztiefe von 0-40 cm für Grünland und 0-100 cm für die vier ADA Ackerfrüchte.

ADA test for year 2015: Independent feedbacks by farmers (field based crop yields)

Major deviations explained by scale uncertainty effects (i.e. biases in ADA soil conditions)

Conclusions

-Simple crop-soil water balance approach satisfactory validated

-Significant relationships of drought/heat impacts on selected main crops

-Crops differ on heat and drought responses under regional conditions in Austria

**-The GIS model enables near time monitoring and forecast
of all simulated crop growing conditions and risk factors**

**(water balance and temperature, biomass development, drought and heat stress and yield depletion)
for agricultural land in Austria**

in a high spatial resolution (0.5 x 0.5km) and daily time step.

-Operational setup and test of the system demonstrated

Potentials

1. High application potential for spatial mapping/forecast of additional weather related risk indicators (i.e. other crop risks from adverse weather conditions).
2. Performance potentials by including remote sensing products.
3. Potential for an operational multiple agricultural risk monitoring and forecasting tool.
4. International cooperation for drought/heat monitoring system increases efficiency and robustness of system performance

Recommendations

1. Operational implementation requests permanent scientific and technical maintenance (financial resources) and institutional cooperation and agreements (weather and forecast data, feedback system - validation etc.)
2. Extending and improving data bases (soil characteristics, crop risks, damage, yields etc.) for further calibration and validation are recommended for permanent improvements of performance and reduction of regional biases and uncertainties.
3. Using stakeholder/user feedbacks to increase user acceptance and fitting to user needs
