

Austrian Circular Economy & De-Carbonisation

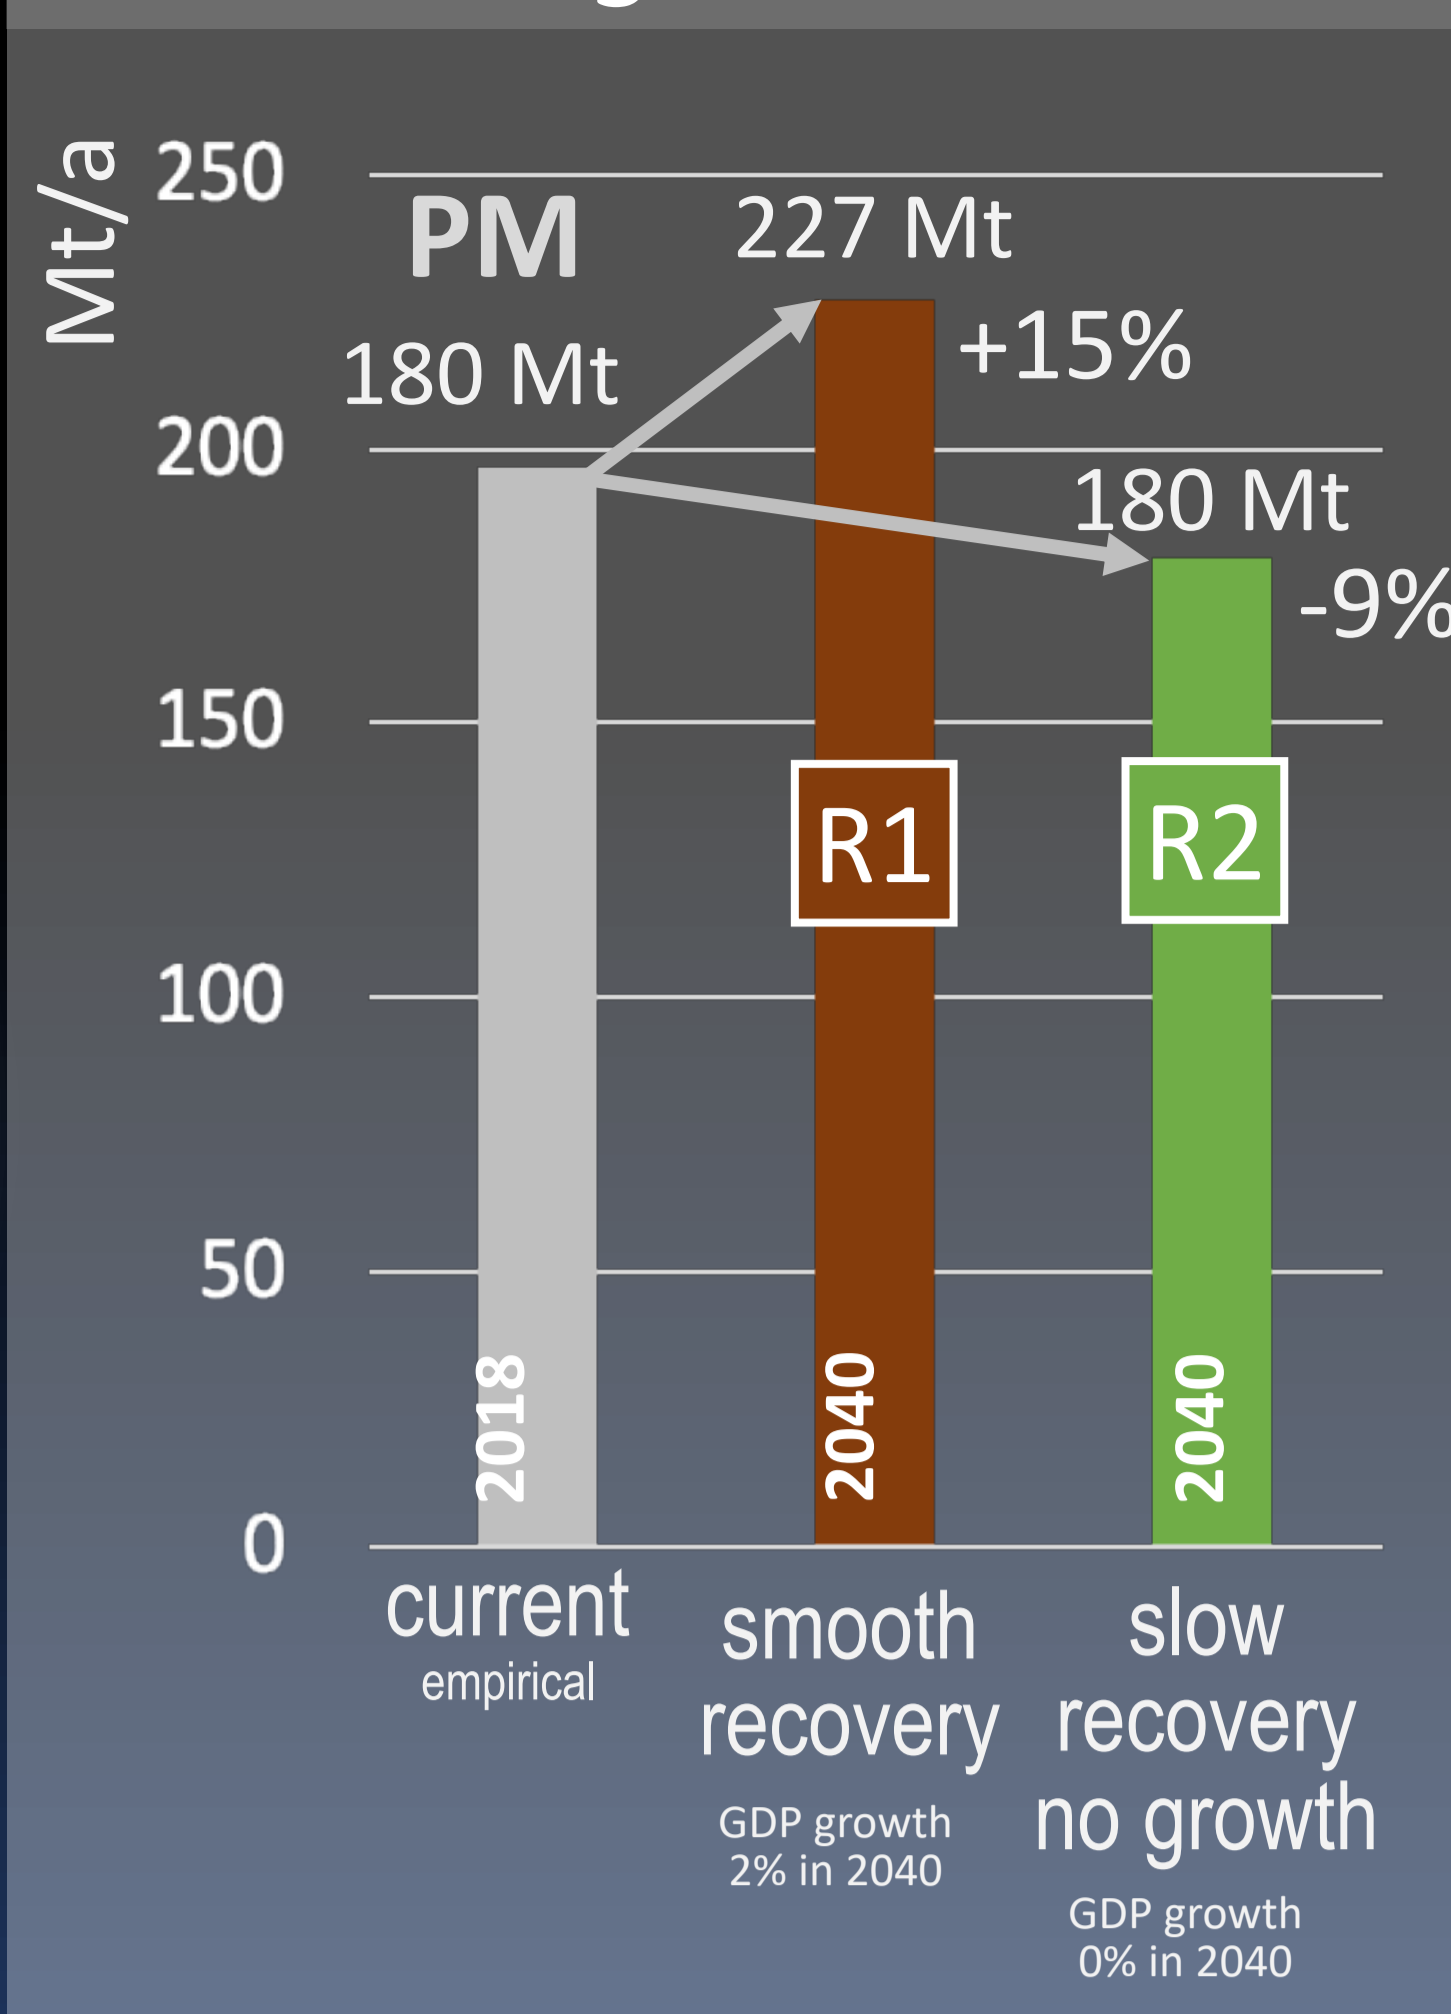

Austria's biophysical economy in 2040

Reference scenario smooth recovery

Scenario guide

How GDP growth matters

Method:

Mass balanced annual modelling of material and energy flows based on (a) two GDP scenarios: (1) smooth recovery R1 and (2) slow recovery and followed by a no growth development R2 and (b) a continuation of past material intensity trends (t/€)

2040 results: Buildings, transport and electricity sector – Decarbonisation and CE strategies

The graphs show how strategies of each scenario reduce the amount of processed materials of the R1 smooth recovery scenario.

The draft of the climate ministry's circular economy strategy sets 7t/cap DMC as goal (BMK, 2021, p.8)

A1 Decarbonisation & Recycle

Material cycles

Recycle, downcycle (backfilling)

building sector decarbonised by 2040

new building standards, insulation, replacement of heating systems (no fossil fuels)

transport sector decarbonised by 2040

moderate modal shift for person and freight transport, vehicle fleet electrification

electricity sector decarbonised by 2030

mainly wind & solar and maintaining level of hydro power

according to available policy documents

B1 Decarbonisation & Reduce

Extended lifespan

Eco-design, reuse, repair

building sector decarbonised by 2040

25% reduced living space per cap for new buildings

transport sector decarbonised by 2040

stronger modal shift with PKW person kilometer (PKM) reduced by 15%

electricity sector decarbonised by 2030

as Scenario A1 but with lower electricity demand by building and transport sector

according to far-reaching strategies

C1 Decarbon. & Deep Reduce

Smarter product use

Highest material efficiency

increasing transformation depth in direction of arrows

building sector decarbonised by 2040

no new buildings in unbuilt areas, meaning only demolished buildings are replaced

transport sector decarbonised by 2040

strongest shift, PKM reduced by 30%, consequent car sharing, deconstructing roads

electricity sector decarbonised by 2030

as Scenario A1 but with lower electricity demand by building and transport sector

own stronger assumptions

Next steps

- CE strategies applied to the entire economy
- Changes in carbon footprint
- Economic feedback loops (soft link)
- Employment and value added
